

Trauma Centers

Level 1: *comprehensive care for any need r/t injury; prevention & research*

Level 2: *can provide care for all injured pts, many of same types of care but often on-call; prevention, no research*

Level 3: *prompt assessment, resuscitation, surgery if needed, stabilize pt; contract w/ another hospital*

Level 4: *(ED) staff have ACLS, stabilize & transfer; can do mild trauma*

Level 5: *evaluate, stabilize, transfer*

Mechanisms of Injury

Radiation	Electrical	Thermal
Chemical	Mechanical	Motion

Motion: car damage helps w/ body damage

Rapid fwd decel - organs on body on tree
Head-on collision - front impact, windshield, steering wheel, dashboard
Dashboard - knee, long-bone, C-spine, pelvis
T-bone - side of body, rib fx from console
Rollover - depends, thrown if no seat belt
Airbags - put seat back as far as possible

Diagnostic Studies

Radiological tests

Diagnostic perineal lavage (now - US)

Labs - ABGs, CBC, coagulation studies (r/t DIC), serum electrolytes

Glucose (r/t stress response)

UA on all trauma pts (tox & pregnancy)

Blood type & screen (transfusion)

Initial Assessment & Management

MAIN GOAL: *minimize time from initial insult to definitive care, optimize pre-hospital care*

Want them to be there within 1 hr of injury

Primary Survey - often in ER, find injuries

Initial Assessment & Management (cont)

- **A** irway
- **B** reathing (*pain, pattern*)
- **C** irculation (*hypovolemic shock common*)
- **D** isability (*LOC, >length w/o consciousness = >disability - Glasgow Coma Scale*)
- **E** xposure (*anything we're missing?*)

Resuscitation Phase

Crystalloids (*isotonic*) → **Colloids** (*large molecules*) → **Blood** (*O-, T&C, type*)

Secondary Survey - History, AMPLE

- **A** llergies
 - **M** edications
 - **P** MH
 - **L** ast meal - (*dec. aspiration risk*)
 - **E** vents preceeding
- Also: examine body, indwelling cath (I&O), NGT (decompress stomach), special procedures (WKG, XR, CT)*

Operative Phase

- Must be as stable as possible

Critical Care Phase - ICU

- Close intensive care, frequent assessments
- IV lines & fluids
- Ventilator

Carotid + = SBP >60 / Femoral + = SBP >70

Radial + = SBP >80

Chest Trauma

Penetrating or blunt
 Children have more pliable chests (cartilage)

Types:

- Myocardial or pulm. contusion
- Rib fx
- Flail chest
- Cardiac tamponade
- Pneumothorax
- Hemothorax

Myocardial/Pulmonary Contusion

Myocardial/Pulmonary Contusion (cont)

Management - ABC(DE)

Pain on breathing → risk for - pneumonia, hypercapnic, hypoxic
 May also see rib fx

Rib Fractures

Common injury usually due to blunt trauma
 - Ribs 4-9 most common, 1-3 take sig. force

Risk for - ARDS

Assessment - hypoventilating → hypoxia hypercapnia

Management - treat pain to prevent ARDS, can get up, move, breathe

Flail Chest

Multiple rib fx, part disconnected (3+) {nl} - Often unilateral, r/t blunt chest trauma

Paradoxical breathing: flail part floats w/ breathing

Risk for - ARDS

Assessment - hypoventilating = hypoxia, hypercapnia

Management - ventilator, PEEP

Cardiac Tamponade

Fluid accumulation in pericardium → dec. CO

Assessment - **Beck's Triad** (*muffled heart sounds, JVD, hypotension*)

Management - supportive, O₂, pericardiocentesis

Heart won't move if 200-300 mL!

Pneumothorax

Injury in which air enters pleural space, usually r/t blunt trauma

Open (opening in chest cavity) vs. **closed**

Assessment

Management - chest tube, pain control, O₂

GOAL: *dec. + pressure & restore - pressure*

Patho - trauma to lung → injury → air enters → lung collapses → alveoli collapse → atelectasis → V/Q mismatch → hypoxia

Myocardial contusion: *bruising to heart; R side most common*

- Dec. contractility → dec. CO

Assessment - c/o CP, SOB

Pulmonary contusion: *bruising to lungs*

- Most common chest injury

Assessment - erythema, bruising on outside, pain w/ breathing

Tension Pneumothorax

Life-threatening complication usually r/t blunt chest trauma (pneumothorax)
- Can quickly be fatal if not detected, treated

Assessment - deviation of everything to unaffected side (trachea); diminished lung sounds, cyanosis, JVD, hypotensive

Management - Release air!

Hemothorax

Usually due to blunt chest trauma or penetrating injury

Simple (1500 mL) or **massive** (3000 mL)

Assessment - dec. breath sounds, hypoxia; percuss = dull on affected side (*may have total of 3 L buildup per side*)

Management - chest tube or surgery

Diagnostic Findings

CXR	fracture, hemo- or pneumothorax
ABG's	hypoxemic, acid-base imbalance
EKG	hypoxemia → arrhythmias
CBC	serial CBC's q6h to determine bleeding, something else

Chest Trauma Management

GOAL: prevent respiratory compromise & complications

Airway

Hemo - replace blood

Chest tube insertion

Check dressing around CT for erythema

IVF & blood replacement

OR depending on severity

No vent → cough, deep breathe (ARDS!), ICS

Splint if rib fx

Pain - nerve block

Abdominal Trauma

Injury blunt or penetrating

Massive blood loss/shock → & not know until severe retroperitoneal

Assessment - s/s may vary greatly, REASSESS!

Pain

Wounds & abrasions

Bruising

Bowel sounds

Balance signs

Kehr's sign: *acute shoulder pain r/t blood/other irritants in peritoneum when pt is lying & legs elevated* = ruptured spleen

Cullen's sign: *bruising below umbilicus*

Turner's sign: *flank bruising*

Diaphragmatic rupture (hear bowel sounds w/ breath sounds)

Hypovolemia w/ large blood loss

Spleen most commonly damaged!

- Abd. aorta, liver, & hepatic vessels

Bladder rupture from blunt trauma

Knife wound w/ evisceration → sterile saline on organs

Impalement injury → STABILIZE & remove in OR

Diagnostic Studies

X-ray

CT scan - GOLD STANDARD FOR INJURIES

CBC (serial H&H)

WBC - inflammation; abd wounds often dirty = prophylactic antibiotics

Serum glucose

Serum amylase

Liver enzymes

US - bleeding?

Peritoneal lavage

Abdominal Trauma Management

GOAL: *correct volume deficit, prevent shock & infection*

Prophylactic antibiotics

IVF - crystalloids, colloids, blood

NGT, Foley

All invasive procedures

Try non-narcotic analgesics → no ileus

Limb Trauma

Types:

- **Strains:** stress injury to muscle at tendon
- **Sprains:** ligament injury
- **Fractures:** break in the bone

Assessment:

Strains & sprains - pain, swelling, tenderness, muscle spasms

Fractures - same + loss of movement, may actually see bone/deformity

Diagnostics - XR (broken bones, visualize structures)

Management - immobilize, RICE

- Compression bandage

- Ice first 24-48 hr, heat to inc. circulation

6 P's of Limb Trauma

CARDIOVASCULAR	NEUROVASCULAR
Pulseless	Paresthesia
Pallor	Paralysis
Polar	
Pain	

Crush Injuries

Blood not circulating

Hypovolemic shock

Paralysis

Erythema - r/t broken blood vessels (= edema) & hard

Damaged body part

Renal dysfunction - rhabdomyolysis

Complications of Trauma

Hypermetabolism - NEED 3,000 cal + regular BMR in first 24-48 hr
- Lose diaphragmatic integrity = won't get off vent, bacteria migrate = VAP
- Promotes healing: inc. permeability of bowel = easier for bacteria to enter blood (infection, sepsis)

Infection - antibiotics prophylactically; seen in first 3 days, may be septic

Sepsis - debride often

Rhabdomyolysis - tissue breakdown → myoglobin released → AKI → renal failure
- Dark, tea-colored urine
- Generalized weakness, muscle stiffness
- Treatment: IVF to clean out kidneys & lg molecules to dec. kidney damage

Multiple organ system dysfunction (MODS)

PULMONARY

Respiratory failure - risk of ARDS

Pulmonary embolism - r/t damages, DIC

Fat embolism syndrome - long bone break = high risk
- Affects clotting system, thrombocytopenia

Pain - always an issue

More Complications of Trauma

GASTROINTESTINAL

Hemorrhage

Acalculous cholecystitis

RENAL

Renal failure

Myoglobinuria

VASCULAR

Compartment syndrome - inc. pressure in confined space = restricts blood flow = area tense, swollen, no pulse → fasciotomy
- *Experienced pain out of proportion with what you would expect*

Venous thromboembolism

Hypotension

Elderly - other comorbidities make recovery difficult
