Agile Development Terms & Terminologies [A-C]

Acceptance Testing	An acceptance test is a formal description of the behaviour of a software product, generally expressed as an example or a usage scenario. Several different notations and approaches have been proposed for such examples or scenarios. In many cases the aim is that it should be possible to automate the execution of such tests by a software tool, either ad-hoc to the development team or off the shelf. [Type – Software Testing / Product Management]

Agile Development Terms & Terminologies [A-C] (cont)

Agile C4Model	C4 Model documents the architecture of a software system, by showing multiple points of view that explain the decomposition of a system into containers and components, the relationship between these elements, and, where appropriate, the relation with its users. The viewpoints are organized according to their hierarchical level: Context Diagrams, Container Diagrams, Component Diagrams, Code Diagrams. [Type – Agile Modelling, Agile Architecture, System Design]

Agile Development Terms & Terminologies [A-C] (cont)

Agile Unified Process	Agile Unified Process (AUP) is a simplified version of the Rational Unified Process (RUP) developed by Scott Ambler. It describes a simple, easy to understand approach to developing business application software using agile techniques and concepts yet still remaining true to the RUP. The AUP applies agile techniques including Test-Driven Development (TDD), Agile Modeling (AM), Agile Change Management, and Database Refactoring to Improve Productivity. Agile Development Terms & Terminologies [A-C] (cont)

Burn Down Charts	The team displays, somewhere on a wall of the project room, a large graph relating the quantity of work remaining (on the vertical axis) and the time elapsed since the start of the project (on the horizontal, showing future as well as past). This constitutes an “Information Radiator“, provided it is updated regularly. Two variants exist, depending on whether the amount graphed is for the work remaining in the iteration (“Sprint Burndown”) or more commonly the entire project (“Product Burndown”). [Type – Agile Project Management]

Agile Development Terms & Terminologies [A-C] (cont)

Constraints A constraint is a restriction on the degree of freedom you have in providing a solution. Constraints are effectively global requirements, such as limited development resources or a decision by senior management that restricts the way you develop a system. Constraints can be economic, political, technical, or environmental and pertain to your project resources, schedule, target environment, or to the system itself. . Constraints are documented in a similar manner to business rules and technical requirements. [Type – Agile Development / Limitations in Development]

Agile Development Terms & Terminologies [A-C] (cont)

Continuous Delivery	Continuous Delivery is the ability to get changes of all types—including new features, configuration changes, bug fixes and experiments—into production, or into the hands of users, safely and quickly in a sustainable way. Our goal is to make deployments—whether of a large-scale distributed system, a complex production environment, an embedded system, or an app—predictable, routine affairs that can be performed on demand. We achieve all this by ensuring our code is always in a deployable state, even in the face of teams of thousands of developers making changes daily. We thus eliminate the integration, testing and hardening phases that traditionally followed “dev complete”, as well as code freezes. [Type – Agile Development / Agile Releases]

Agile Development Terms & Terminologies [A-C] (cont)

Continuous Deployment	Continuous deployment aims to reduce the time elapsed between writing a line of code and making that code available to users in production. To achieve continuous deployment, the team relies on infrastructure that automates and instruments the various steps leading up to deployment, so that after each integration successfully meeting these release criteria, the live application is updated with new code. Cumulative Flow Diagram	The Cumulative Flow Diagram (also known as CFD) is one of the most advanced Kanban and Agile analytics charts. It provides a concise visualization of the three most important metrics of your flow: Cycle Time, Throughput, Work in Progress. Its main purpose is to show you how stable your flow is and help you understand where you need to focus on making your process more predictable. It gives you quantitative and qualitative insight into past and existing problems and can visualize massive amounts of data. [Type – Agile Project Management]

Disciplined Agile Delivery (DAD)	Disciplined agile delivery (DAD) is the software development portion of the Disciplined Agile Toolkit. DAD enables teams to make simplified process decisions around incremental and iterative solution delivery. DAD builds on the many practices espoused by advocates of Agile Software Development, including Scrum, Agile Modeling, Lean Software Development, and Others. The primary reference for disciplined agile delivery is the book Choose Your WoW! written by Scott Ambler and Mark Lines. [Type – Agile Variant]

Agile Development Terms & Terminologies [D-L] (cont)

Earned Value Management	Earned Value Management (EVM) is a project management technique that measures the technical performance, cost and schedule of a project against planned objectives. The result is a simple set of metrics that provides early warnings of performance issues, allowing for timely and appropriate adjustments. EVM also improves the definition of project scope and provides valuable metrics for communicating progress to stakeholders. To implement EVM, you need to measure some basic metrics like a valuation of planned work, called planned value (PV). Agile EVM is a lightweight and easy to use adaptation of the traditional Earned Value Management technique which provides the benefits of traditional Earned Value Management for Scrum. Agile Development Terms & Terminologies [D-L] (cont)

Fibonacci Scale	In Agile software development, the Fibonacci scale consists of a sequence of numbers used for estimating the relative size of user stories in points. Agile Scrum is based on the concept of working iteratively in short sprints, typically two weeks long, where the requirements and development are continuously being improved. The Fibonacci sequence consists of numbers that are the summation of the two preceding numbers, starting with [0, 1]. Agile uses the Fibonacci sequence to achieve better results by reducing complexity, effort, and doubt when determining the development time required for a task, which can range from a few minutes to several weeks. Fishbone Diagram

The Fishbone Diagram (also called Ishikawa Diagram, Cause and Effect Diagram) got its name from its similarity of its shape to that of a fish skeleton. The Ishikawa Diagram relates to the seven basic tools of measurement, evaluation, control, and improvement of a production processes. Fishbone Diagrams are used to study, to display graphically, and analyze multiplicity of causes that influence the occurrence of a problem being solved and their impact. Lean It turns out that Lean projects are quite effective if they incorporate Agile concepts into their execution. After all, Lean means lean, without excess or waste, something that meets all that the Agile methodologies propose. Lean-Agile is a set of principles and practices for working that aims to minimise waste whilst maximising value. This enables organisations to make quality a priority in their products and services. Agile Development Terms & Terminologies [M-R]

Managed Agile Develo-pment	The Managed Agile Development Framework described in this chapter is a project-level framework that is intended to provide a balance of agility combined with some level of predictability and control. It is intended for companies that are unable or not ready to move to a more complete top-to-bottom agile model such as the Scaled Agile Framework. It is a hybrid software development lifecycle model consisting of a blend of an adaptive agile development approach based on Scrum at the micro-level and a more traditional plan-driven approach at the macro-level, as shown below (Credits to O'Reilly Publishers) [Type – Hybrid Agile]

Agile Development Terms & Terminologies [M-R] (cont)

Minimum Viable Product (MVP)	A Minimum Viable Product is, as Eric Ries said, the "Version of a New Product which allows a team to collect the maximum amount of validated learning about customers with the Least Effort." This validated learning comes in the form of whether your customers will purchase your product. A key premise behind the idea of MVP is that you produce an actual product (which may be no more than a landing page, or a service with an appearance of automation, but which is fully manual behind the scenes) that you can offer to customers and observe their actual behavior with the product or service. Seeing what people do with respect to a product is much more reliable than asking people what they would do. [Type – Agile Releases/Product Management]

Pareto Chart

One of the core principles of Agile development is the Pareto Principle. It basically says 80% of the impact can be generated by focusing on 20% of the problems. Rapidly iterate on the set of problems by focusing on solving only the 20% that provide 80% impact each iteration quickly, faster and faster every time. Minimum effort maximum returns. The secret to success by achieving more with less. Do more by doing less. 80-20 rule helps move away from chaos and bring clarity part by part. Keeps you moving fast. Sprint Backlog

A sprint backlog is the subset of product backlog that a team targets to deliver during a sprint to accomplish the sprint goal and make progress toward a desired outcome. The sprint backlog consists of product backlog items that the team agreed with their product owner to include during sprint planning. The team owns the sprint backlog and can determine whether new items are added, or existing items are removed. This allows the team to focus on a clear scope for the length of the sprint. Some teams may allow the inclusion of a new product backlog item if it replaces a product backlog item of equal or greater size that already exists on the sprint backlog. Story Mapping

Story Mapping or User Story Mapping is a technique used in product discovery: outlining a new product or a new feature for an existing product. The result is a Story Map: all the user stories arranged in functional groups. This helps you keep your eye on the big picture while also providing all the details of the whole application. The main purpose of Story Mapping is to facilitate product discovery and prioritization of development work. You achieve this by putting user activities and tasks on a map that serves to keep them in context. [Type – Agile Product Management]

Agile Development - Management Software & Tools (cont)

Zoho Sprints	Zoho Sprints is a free online tool that is used for agile planning and tracking. It helps in creating effective user stories, scheduling agile meetings, using timesheets, and adding estimation points for tracking the work hours. The main purpose of Zoho Sprints is to bring agility to the project development lifecycle. Being agile is a project management method that helps in building an iterative process where teams can quickly react to changes. This is an approach that is entirely different from the traditional waterfall model which is much more focused on testing only after the final product is built. Apt Quotes - Agile Development (cont)

"Your success in life isn't based on your ability to simply change. It is based on your ability to change faster than your competition, customers, and business." **Mark Sanborn**
